RTO Software Adds Advanced Enterprise Management Reporting Capabilities Through Partnership with XTS

ATLANTA (February 27, 2007) – RTO Software, a global provider of application availability and performance management solutions for business-critical applications, announced today that it has partnered with XTS to provide powerful historical reporting and trend analysis capabilities of Access Tracking Manager™ to existing and potential customers of RTO PinPoint™.

XTS Access Tracking Manager (ATM) is an automated reporting solution that will plug into and extend the value of RTO PinPoint. With little effort, users will be able to quickly create and schedule reports on a wealth of data including user, application, process, and server activity.

“The addition of ATM to RTO PinPoint creates significant value for our customers because they can now obtain much richer reports through the combination of these two best-of-breed solutions,” said Kevin Goodman, CEO of RTO Software. “The partnership reaffirms the increasing importance of securing the most robust reporting capabilities for today’s demanding IT and business managers.”

The new report-generation capabilities will not only enhance application performance management, but will also provide the ability to perform the critical analyses required for accurate capacity planning, compliance and security audits.

“Enterprises are constantly challenged to meet application performance and availability goals in an increasingly complex environment”, explained Milind Govekar Research VP, Gartner. “So Enterprise IT needs to look at solutions that are able to proactively identify application performance and availability issues and provide their end users with increased visibility towards application oriented service level information. This will enable them to better justify alignment with the business requirements and improve the business value of the services they provide.”

“ATM is a unique enterprise management reporting and analysis product that leverages a powerful analytics engine to extract and report historical system and performance information,” said Eric Spiegel, CEO of XTS. “With ATM, RTO customers will gain new insights into what resources are being consumed and by whom.”

The seamless interaction of ATM with RTO PinPoint means that no extra effort will be required for installation or deployment. Users will have instant access to powerful and flexible reporting capabilities, including easy-to-interpret charts and graphs that can be exported to Excel, HTML, PDF, Crystal Reports or XML.

This combined best of breed solution will be available immediately from RTO. Please contact RTO Sales for further information.

About XTS

XTS is the leading provider of enterprise management reporting software for the planning and management of Citrix and other virtualization platforms. XTS (www.xtsinc.com) is headquartered in the Washington DC metropolitan area and is a Citrix Global Alliance Partner.
