RTO Optimization Console

A valuable tool for Citrix Presentation Server™ 4.0 deployment

The RTO Optimization Console gives you total control over the new Citrix Memory Optimization Management function available in Citrix Presentation Server™ 4.0. Citrix licensed RTO Software's patented server performance optimization technology for incorporation into Citrix Presentation Server. And now, the RTO Optimization Console makes the Citrix Memory Management optimizations work for you. With the RTO Optimization Console, you have memory optimization tuning that is not available in Citrix Presentation Server 4.0, such as component exclusion list management, optimization history reporting, and optimization scheduling.

The RTO Optimization Console is free for use when managing a local Citrix Presentation Server. The multiple server mode allows you to easily handle memory optimization for your entire Citrix Presentation Server farm from one location, and requires a license from RTO Software.

Centralized management and control for TScale® Advanced

The RTO Optimization Console is a multi-server, centralized management console that allows administrators to handle all installation, management, reporting and maintenance of TScale® and RTO TScale *Advanced* across large server farms in a Citrix or Terminal Services environment. You can easily handle memory optimization, performance tuning and reporting from a single location. This gives you greater control over optimization settings, and can enable you to optimize your server to a much higher degree.

Key benefits

Greater performance

Configuration and management that is not available in Citrix Presentation Server 4.0 allows for increased performance and scalability. Component exclusion lists allow for greater flexibility and fine-tuned optimizations.

Simplified installation

In addition to the unique performance tuning for Citrix Presentation Server 4.0, the RTO Optimization Console gives you, it can also be used to install RTO optimization agents on multiple servers from a single console, for immediate deployment, or on a scheduled basis.

Performance Optimization for Citrix and Terminal Services

"After evaluating the top technologies in this space, we selected RTO Software—a proven market and technical leader—in order to improve the performance and end-user experience for our Citrix Presentation Server customers."

*Tony Marzulli,
Senior VP of Marketing,
Citrix Systems, Inc.*

"With the RTO Optimization Console, Citrix customers can enjoy enhanced memory performance tuning and reporting and achieve greater returns on their Citrix access investment."

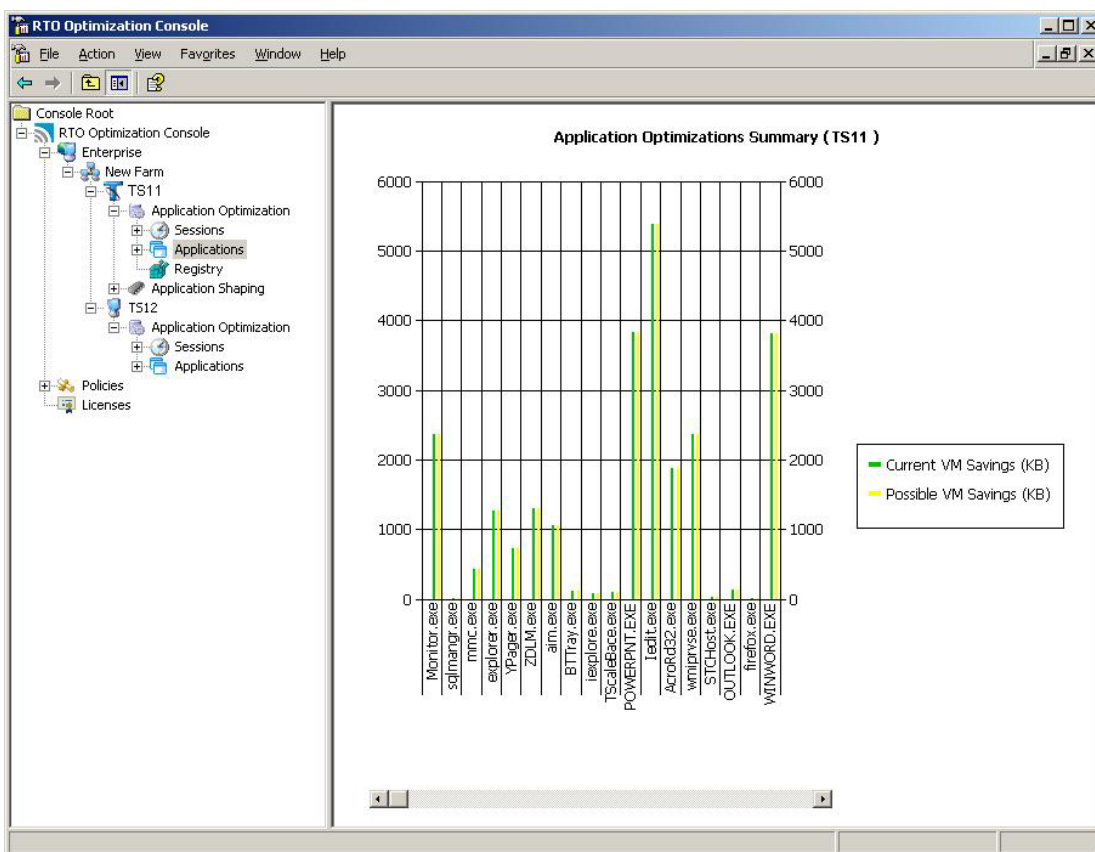

*David Jones,
Senior VP of Corporate
Development,
Citrix Systems, Inc.*

No agent is required for Citrix Presentation Server 4.0. Change a setting in one place and apply it across the server farm with a single 'click'. The Optimization Console's role-based security lets you determine exactly who can install, monitor or change optimization settings.

More control

You can control optimizations at the DLL, application, group or farm levels, enabling you to optimize more applications, and control optimizations at a more granular level.

With the RTO Optimization Console, you can view and manage your application memory optimization for Citrix Presentation Server 4.0, RTO TScale, and RTO TScale Advanced.

View memory optimization results for any managed server. You can see overall optimization by session, or drill down to see which components have been optimized for each application on a server.

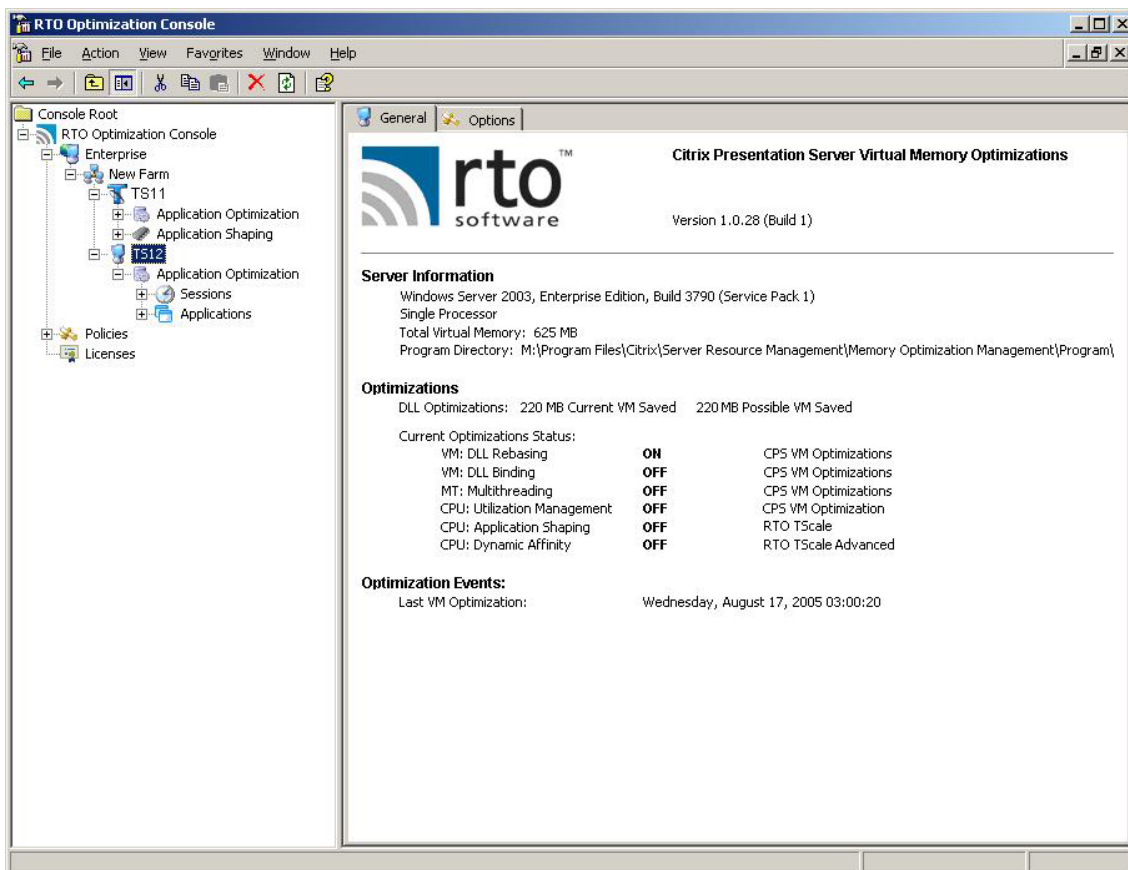

Consistent deployment

Server groups and policies give you the ability to manage similar servers in a consistent manner. Your settings for Memory Optimization Management are managed consistently for all servers in a group of Citrix Presentation Servers. Each server group can have different policies and settings. Likewise, your TScale Advanced settings for performance optimization can be managed consistently for all servers in a group.

Policy-based management

You can set up profiles or policies that can be applied globally across the entire server farm, to groups of servers, or to selected servers, further simplifying management and enabling consistency. Policies can be locked to override changes made later to an individual server. And role-based security lets you specify which administrators can view or control optimization settings.

Make Citrix Presentation Server 4.0 work for you. Control all aspects of the new Memory Optimization Management.

Improved efficiency

The RTO Optimization Console dramatically improves planning and troubleshooting, changing a manual process requiring hours of your time to an automated process that takes minutes. For example, you can disable optimization at the component, application, server or farm level in a matter of seconds. You can also export optimization results for further analysis with Microsoft Excel®.

Lower total cost of ownership

The RTO Optimization Console reduces configuration complexity, lowers administrative overhead, and reduces implementation time, while improving overall performance of your server farm.

RTO Optimization Console requires the following environment

The RTO Optimization Console minimum requirements include Microsoft Windows NT 4.0 (with Service Pack 6a), 2000, XP or 2003 operating system, Microsoft Management Console (MMC) 1.1a, domain administration privileges for managed domains.

About RTO Software

RTO Software, Inc. is an established provider of application-focused performance monitoring tools. As an innovative leader in this rapidly growing area, we provide software tools and consulting services to enterprises and software firms that want to improve the performance and capacity of applications operating in a Windows environment.
